EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Tom Hunter on April 8, 2005.

The application has been amended as follows:

Cancel claims 39 – 58 and 63.

Replace claim 62 with the following:

62. A kit for coupling an organic molecule to the surface of a type III, IV, or V material, said kit comprising:

a container containing a heat resistant organic molecule derivatized with an attachment group, and

instructional materials teaching coupling the organic molecule to the surface by heating the surface to a temperature of about 200 °C or more.

In the specification, paragraph [0113], line 12, replace "200" with "170".

Art Unit: 2891

2. The following is an examiner's statement of reasons for allowance: the applicant discloses a novel method of covalently coupling an organic molecule to the surface of a group III, IV, or V element where, in the context of the entire claim, the surface is heated to at least about 200 °C where the attachment group forms a covalent bond with the surface.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

3. A copy of the search history (EAST and STN) is enclosed.

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. The cited prior art describes methods of forming organic memory structures by covalently bonding an organic molecule to a substrate and prior art mentioned in the specification which was not listed on the IDS filed on December 6, 2004.

In particular, Liu *et al.* (Synthesis of porphyrins bearing hydrocarbon tethers and facile covalent attachment to Si(100)) teaches a heating method of at least 200 °C, but was published after the effective filing date of the application. Roth *et al.* (Measurements of electron-transfer rates of charge-storage molecular monolayers on Si(100)) also teaches a heating method but only to a temperature of 170 °C.

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Christian Wilson whose telephone number is (571) 272-1886. The examiner can normally be reached on weekdays, 7:30 AM to 4 PM.
